The Rainbow Natural Bridge, Utah

NATURE'S largest known bridge formation, amazing as it might seem, was undiscovered until August 14, 1909. This bridge, the spread of whose arch is six times as great as that of the Natural Bridge of Virginia, would amply span the dome of the United States Capitol, standing nearly as high as the Flatiron Building in New York City. It is sometimes called "Nonnezoshi," the Indian name for stone arch, and is in that region of Utah now set aside as a reservation for the Pahutes.
